Assignment 3 - Transactions
Sam Student

Q1. A transaction is all or nothing: either every operation in it is applied, or none of them are. If something fails in the middle, the database rolls back the changes that were already made, so we never see half of a transaction.

Q2. A dirty read is when a transaction reads a value that another transaction has written but not committed yet. If the other transaction then rolls back, the first one has used data that never really existed. The READ COMMITTED isolation level prevents dirty reads.
